The Invariant Content of Equivalent Theories

Hans Halvorson

June 23, 2016

spoiler alert!

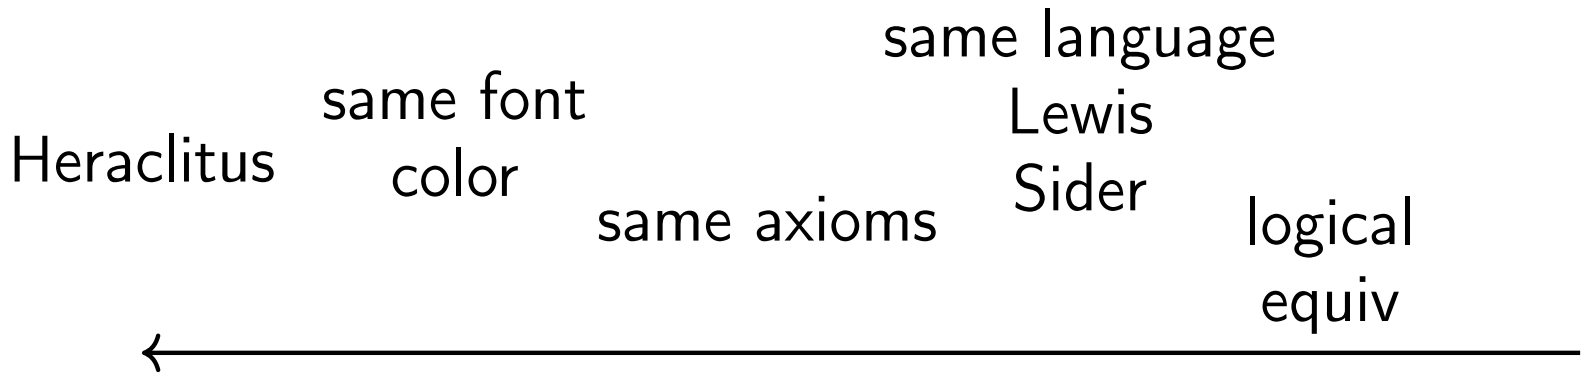

It isn't much!

It isn't nothing!

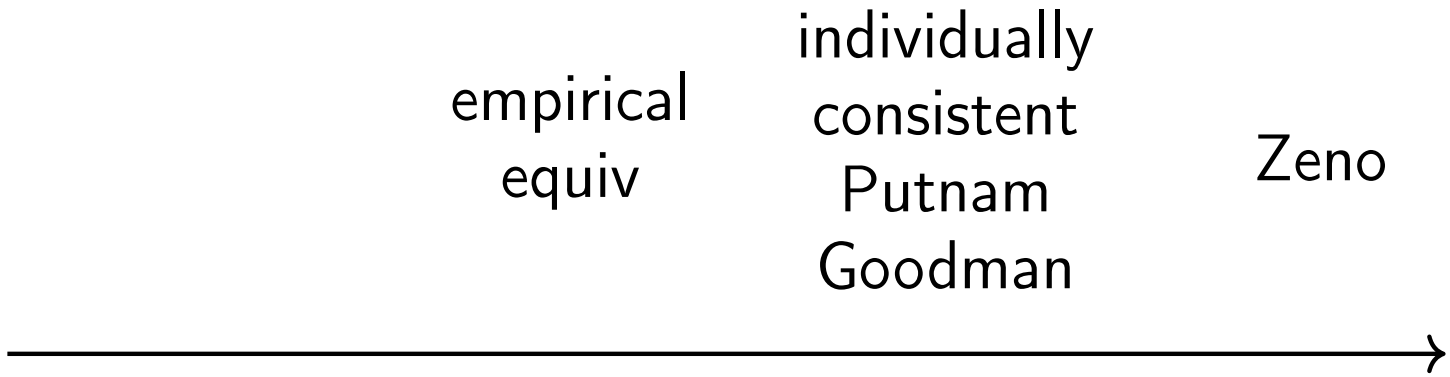

pragmatic prolegomena

- When can debate end?
- When is more investigation called for?
- For what should I be willing to take a stand?
- Invariants as necessary conditions

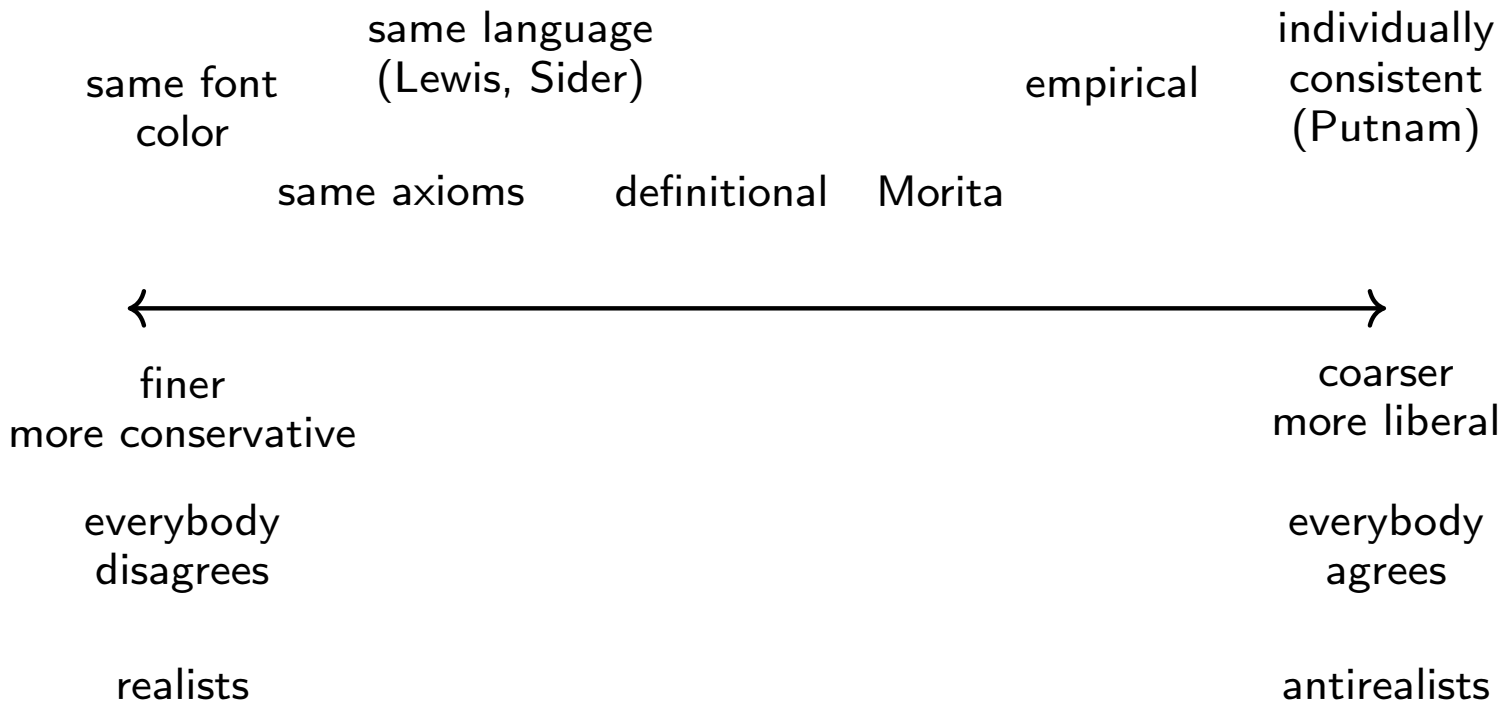

radical right wing

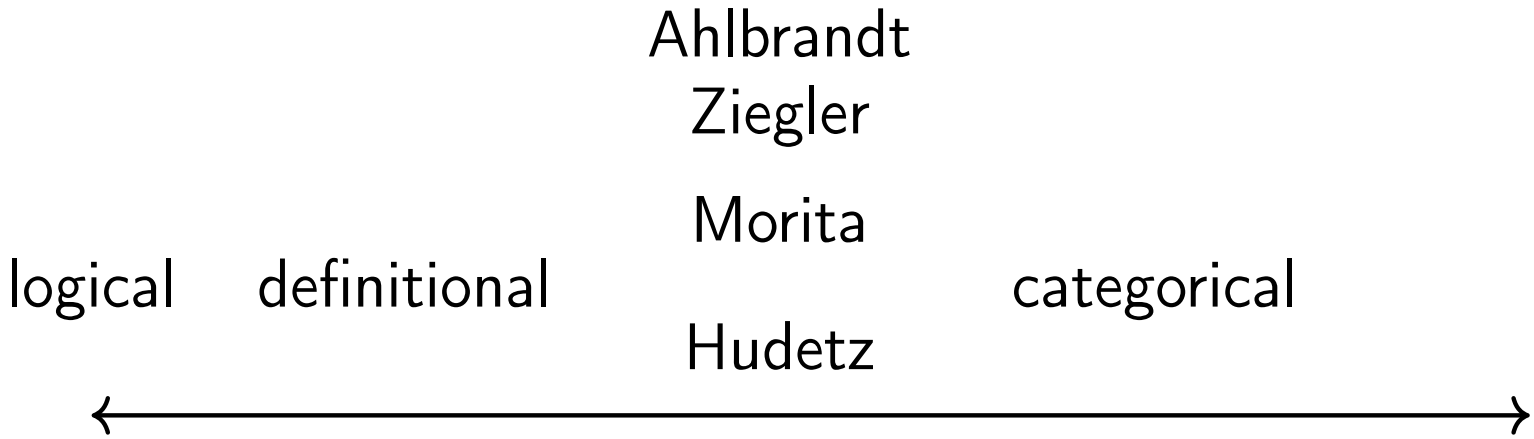

radical left wing

the ideological spectrum

non-absurd views

logical equivalence

- T_1 and T_2 are **logically equivalent** just in case they are in the **same** signature and:

$$\mathbf{Cn}(T_1) = \mathbf{Cn}(T_2)$$

$$\mathbf{Mod}(T_1) = \mathbf{Mod}(T_2)$$

- Overly restrictive: same signature

definitional extension

- Example: define $\leq$ by

$$\forall x, y(x \leq y \leftrightarrow (x < y \vee x = y))$$

- **Defn:** T^+ is a **definitional extension** of T just in case for each new relation symbol r of Σ^+, there is a formula Fr of Σ such that:

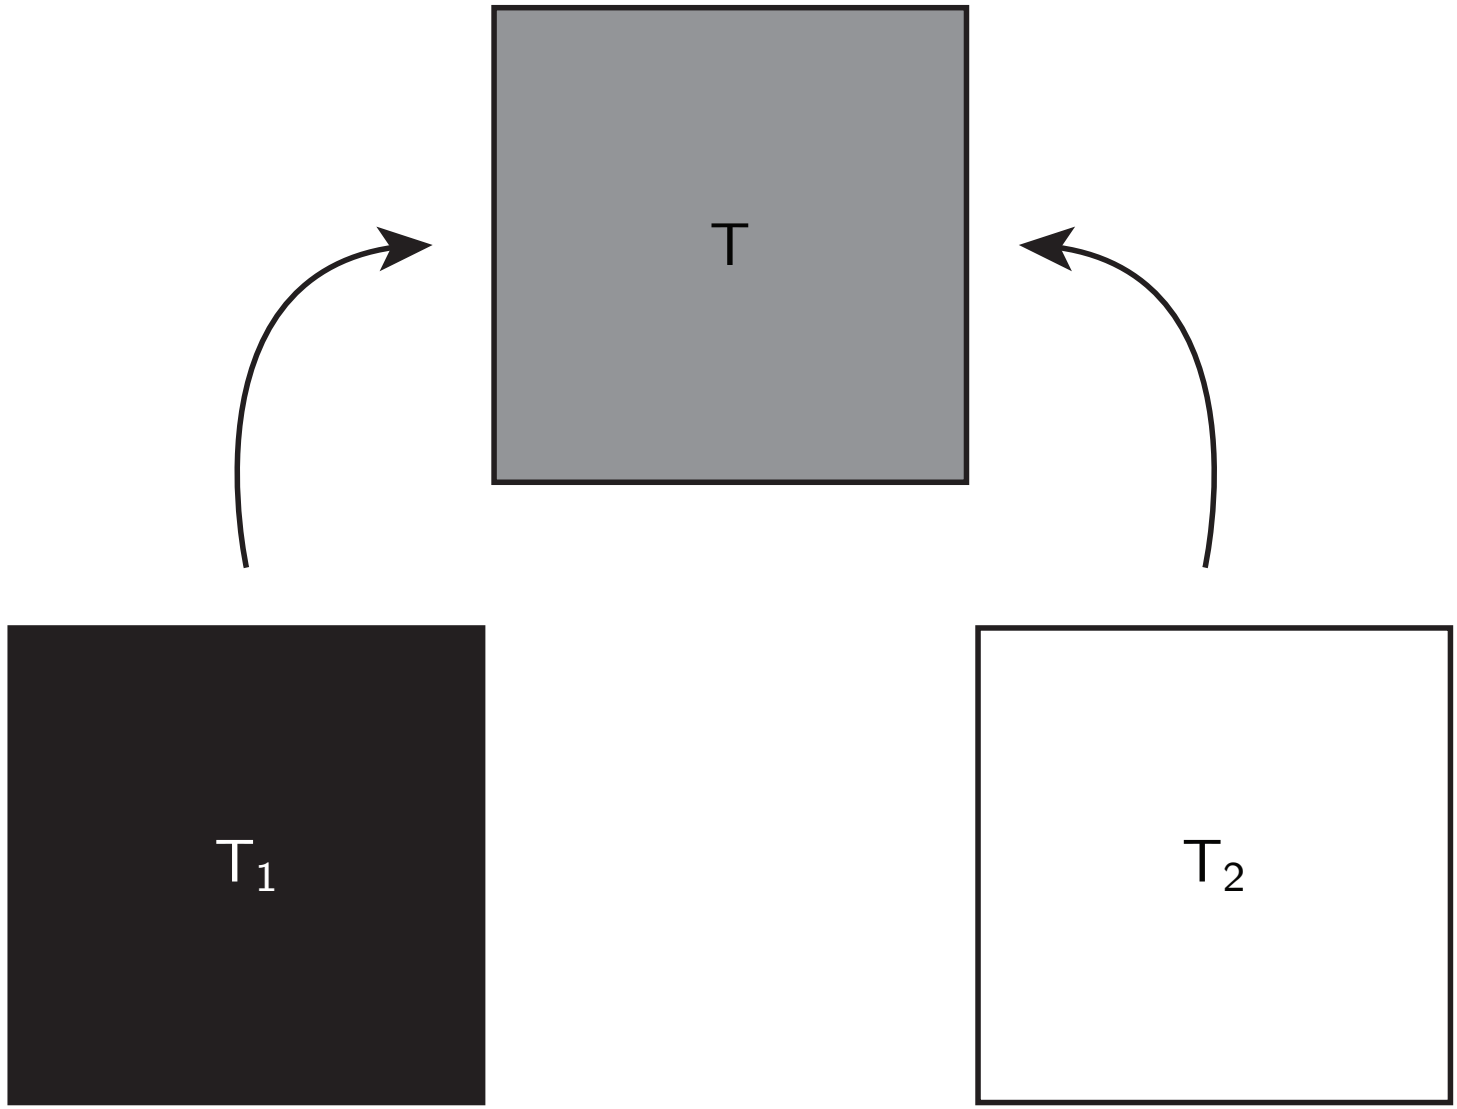

$$T^+ \vdash \forall \overline{x}(r(\overline{x}) \leftrightarrow (Fr)(\overline{x})).$$

definitional extension

- $r \mapsto Fr$ extends to an **interpretation** $F : T^+ \to T$.
- Each model M of T is uniquely expandable to a model $F^*(M)$ of T^+, where

$$M \vDash (F\phi)(\bar{a}) \quad \Longleftrightarrow \quad F^*(M) \vDash \phi(\bar{a})$$

T_1 and T_2 are **definitionally equivalent** if they have a **common definitional extension**.

Prop: T_1 and T_2 are definitionally equivalent if and only if there are **direct** translations $F : T_1 \to T_2$ and $G : T_2 \to T_1$ that are quasi-inverse to each other.

invariants of DEF

1. numerical claims
2. cardinality of models
3. definable subsets of models

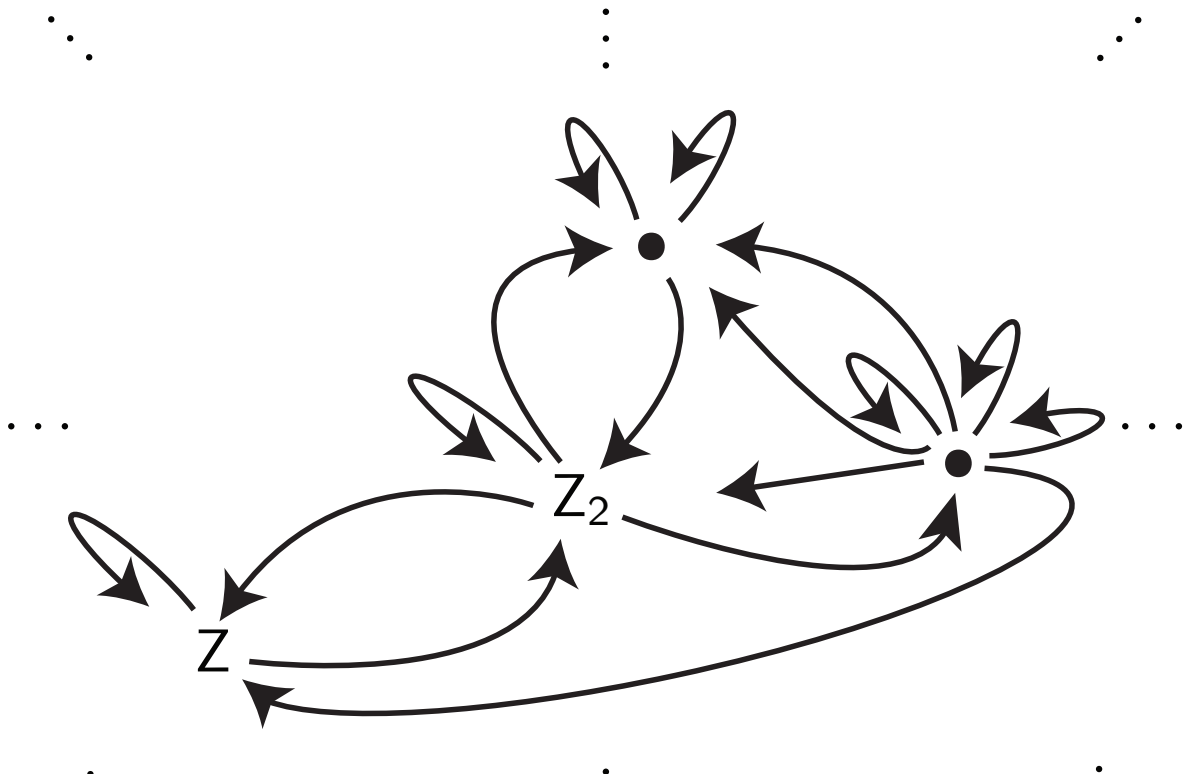

reasons to liberalize

- Direct translation is overly restrictive
- DEF too restrictive for the scientific & mathematical mainstream
  - Wave vs Matrix mechanics
  - Tarski's axiomatizations of geometry
  - Dualities in math and physics

Consider $\mathbf{Mod}(T)$ as consisting of two kinds of things:

objects models of T

arrows elementary embeddings of models

categorical equivalence

objects of $\mathbf{C}$ $\longmapsto$ objects of $\mathbf{D}$

arrows of $\mathbf{C}$ $\longmapsto$ arrows of $\mathbf{D}$

(1) plays nicely with composition of arrows
(2) quasi-invertible

$$\text{logical} \implies \text{definitional} \implies \text{categorical}$$

Goodmania?

T_1 There is exactly one thing, named c_1.

T_{17} There are exactly seventeen things, named $c_1, c_2, \ldots, c_{17}$

 $\mathbf{Mod}(T_1) \equiv \mathbf{Mod}(T_{17})$ 

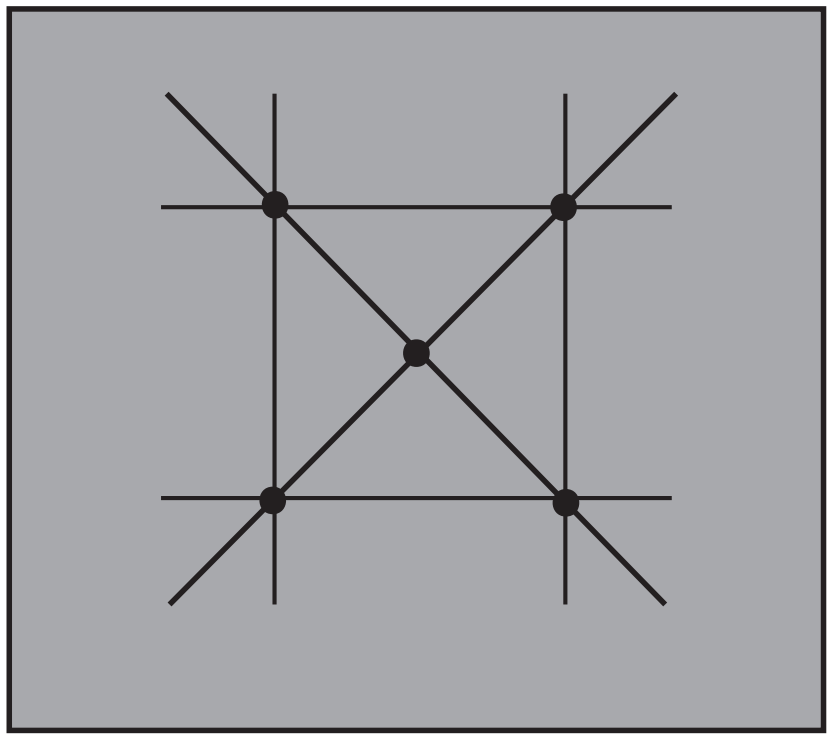

Morita equivalence

- **many-sorted logic:** Signatures include **sort symbols**, rather than just relation symbols.
- Morita extension:
  - product sorts
  - quotient sorts
  - subsorts
  - coproduct sorts
- **Defn:** T_1 and T_2 are **Morita equivalent** just in case they have a common Morita extension.

Morita equivalence

Morita $\Longrightarrow$ categorical

Invariant lost: cardinality of models

$$\text{logical} \implies \text{definitional} \implies \text{Morita} \implies \text{categorical}$$

Ahlbrandt-Ziegler equivalence

- **Defn:** An m-dimensional **translation** $F : T_1 \to T_2$ assigns to each formula $\phi(\overline{x})$ of T_1, a formula $(F\phi)(\overline{y}_1, \ldots, \overline{y}_m)$ of T_2.
- **Fact:** A translation $F : T_1 \to T_2$ induces a functor $F^* : \mathbf{Mod}(T_2) \to \mathbf{Mod}(T_1)$.

AZ equivalence

Defn: T_1 and T_2 are **AZ equivalent** just in case there is a translation $F : T_1 \to T_2$ such that $F^* : \mathbf{Mod}(T_2) \to \mathbf{Mod}(T_1)$ is an equivalence of categories.

$$\text{logical} \implies \text{definitional} \implies \text{AZ} \implies \text{categorical}$$

conjecture

$$\text{Morita} \overset{?}{\Longleftrightarrow} \text{AZ}$$

application: Hamiltonian and Lagrangian mechanics

- J. North: "Hamiltonian and Lagrangian mechanics are not equivalent in terms of statespace structure. This means that they are not equivalent, period."
- T. Barrett: Hamiltonian and Lagrangian mechanics are categorically equivalent.

application: acceptance

- ACCEPT: To accept T is to believe that one of the models of T is isomorphic to WORLD.
- EQUIV: If T_1 is equivalent to T_2, then to accept T_1 is to accept T_2.
- Morita + EQUIV rules out ACCEPT.

application: wavefunction realism

- **Hilb** is categorically equivalent to **CStar**
- **CStar** doesn't talk about wavefunctions.
- So, take your wavefunction *cum grano salis*.

conclusions

- Carnapian tolerance: there is no question of *correctness* when it comes to notions of theoretical equivalence.
- Second order morals: (1) clarity, (2) tolerance of dissenters.
